

Flipkart Low-Rating Review Dataset — Data Collection Process

Overview

This project collects raw HTML data from Flipkart for products with **poor customer ratings (1★–3★ reviews)**. The goal is to build a labeled dataset of 500 products, each with its product-details page and review page saved locally, plus a master index in Google Sheets for tracking and reference.

1. Data Sourcing

Source site: <https://www.flipkart.com/>

Target criteria: Products whose customer reviews skew negative — focus on listings showing predominantly **1, 2, or 3 star** ratings. These are the "worst case" reviewed products for this dataset.

2. Google Sheet — Master Index

Create a Google Sheet to track every product collected. It must have exactly these three columns:

Column	Description
Product Name	Full product title as shown on Flipkart
Product Details Link	URL of the product's details/description page
Product Review Link	URL of the product's review listing page

Target: 500 rows (500 products) before moving to the download phase.

Tip: Keep the sheet as the single source of truth. Every folder created in Step 3 should correspond to exactly one row here, and the folder name should match **Product Name** exactly (see naming convention below).

3. HTML File Collection

Once the sheet has product entries, download the raw HTML for each product.

Folder Structure

For every product, create a parent folder named **exactly** after the **Product Name** value from the sheet, containing two subfolders:

```
Data Html File Download Dir/  
└─ <Product Name>/
```

```
├─ product/    → product details page HTML
└─ review/     → product reviews page HTML
```

Example:

```
Data Html File Download Dir/
├─ Casado Branded Bracelet | Gold Plated | Diamond Studded | 3D Cut Glass
  | Day and Date Analog Watch - For Men 632-GOLD-GOLD-BRACELET/
  │   ├─ product/
  │   │   └─ product.html
  │   └─ review/
  │       └─ review.html
```

Per-Product Steps

1. **Open the product details page** (from the **Product Details Link** column), e.g.:

```
https://www.flipkart.com/casado-branded-bracelet-gold-plated-diamond-
studded-3d-cut-glass-day-date-analog-watch-men/p/itme704daf454150?
pid=WATGW3ZY7YKSXVPK&lid=LSTWATGW3ZY7YKSXVPKZN5VLE...
```

Save the fully rendered page HTML into that product's **product/** folder.

2. **Open the corresponding reviews page** (same product/listing IDs, but the **/p/** path segment becomes **/product-reviews/**), e.g.:

```
https://www.flipkart.com/casado-branded-bracelet-gold-plated-diamond-
studded-3d-cut-glass-day-date-analog-watch-men/product-
reviews/itme704daf454150?
pid=WATGW3ZY7YKSXVPK&lid=LSTWATGW3ZY7YKSXVPKZN5VLE&marketplace=FLIPKAR
T
```

Save the fully rendered page HTML into that product's **review/** folder.

3. **Repeat** for all 500 products listed in the Google Sheet.

URL Pattern Reference

Page Type	URL Pattern
Product Details	<code>.../p/<itemId>?pid=<pid>&lid=<lid>&marketplace=FLIPKART...</code>
Product Reviews	<code>.../product-reviews/<itemId>?pid=<pid>&lid=<lid>&marketplace=FLIPKART</code>

The **product-reviews** URL is derived from the details URL by swapping **/p/** for **/product-reviews/** and keeping the same **pid** and **lid** query params.

4. Naming & Consistency Rules

- Folder names must match the sheet's **Product Name** column **verbatim**, including punctuation and casing, so files can be traced back to their sheet row programmatically.
 - Keep one **product/** and one **review/** HTML file per product folder — avoid saving duplicate or partial page loads.
 - If a product name contains characters invalid for folder names on your OS (e.g. **/, \, :, *, ?, ", <, >, |**), sanitize consistently (e.g. replace with **-**) and keep a mapping if the sheet needs the original name preserved.
-

5. Suggested Workflow Order

1. Browse Flipkart, identify low-rated products → add rows to the Google Sheet (**Product Name**, **Product Details Link**, **Product Review Link**).
 2. Once the sheet reaches 500 entries, batch through it top to bottom.
 3. For each row: create the product folder, save **product/** HTML, save **review/** HTML.
 4. Spot-check a sample of saved files to confirm both pages loaded fully (not partial/loading-state HTML) before moving to the next product.
-

Notes

- Only publicly accessible pages should be collected, and collection should stay within Flipkart's terms of service and applicable data-use laws — worth a quick review before scaling this beyond manual, ad-hoc collection.
- Consider adding a **Status** column (e.g. **Pending** / **Downloaded** / **Verified**) to the sheet to track progress across the 500 items.
